Custom keyboard configuration (suitable for up to 5 door buses etc)

Door bindings

Open/close all doors `door_all`

Open/close first door (or incase of MAN SD buses and some other first door first part)

`bus_doorfront0`

Open/close second door (or incase of MAN SD buses and some other first door second part)

`bus_doorfront1`

Open/close third door `bus_doorfront2`

Open/close fourth door `bus_doorfront3`

Open/close fifth door `bus_doorfront4`

Custom keyboard configuration

Here you can download Gameburrow's custom keyboard configuration that has ll these keys mapped:

<https://cloud.gameburrow.codes/s/Xi3oWKaArtKrwq4>

Changes from default:

`Shift` + `Num 0`: Open/close all doors

`Shift` + `Num 1` - `Num 5`: Open close 1 - 5 doors

`Shift` + `Num Enter`: Station Brake

`K` / `Shift` + `K` - Kneeling toggle (for some buses just pressing `K` toggles/untoggles, for some you need to press `K` to toggle and `Shift` + `K` to untoggle, for some this bind doesn't work at all)

Alternatively, if you want to add the keys manually, you can edit the following file `OMSI`

`2/inputs/keyboard.cfg`:

```
[entry]
door_all
82
2
```

```
[ entry]  
bus_doorfront0  
79  
2
```

```
[ entry]  
bus_doorfront1  
80  
2
```

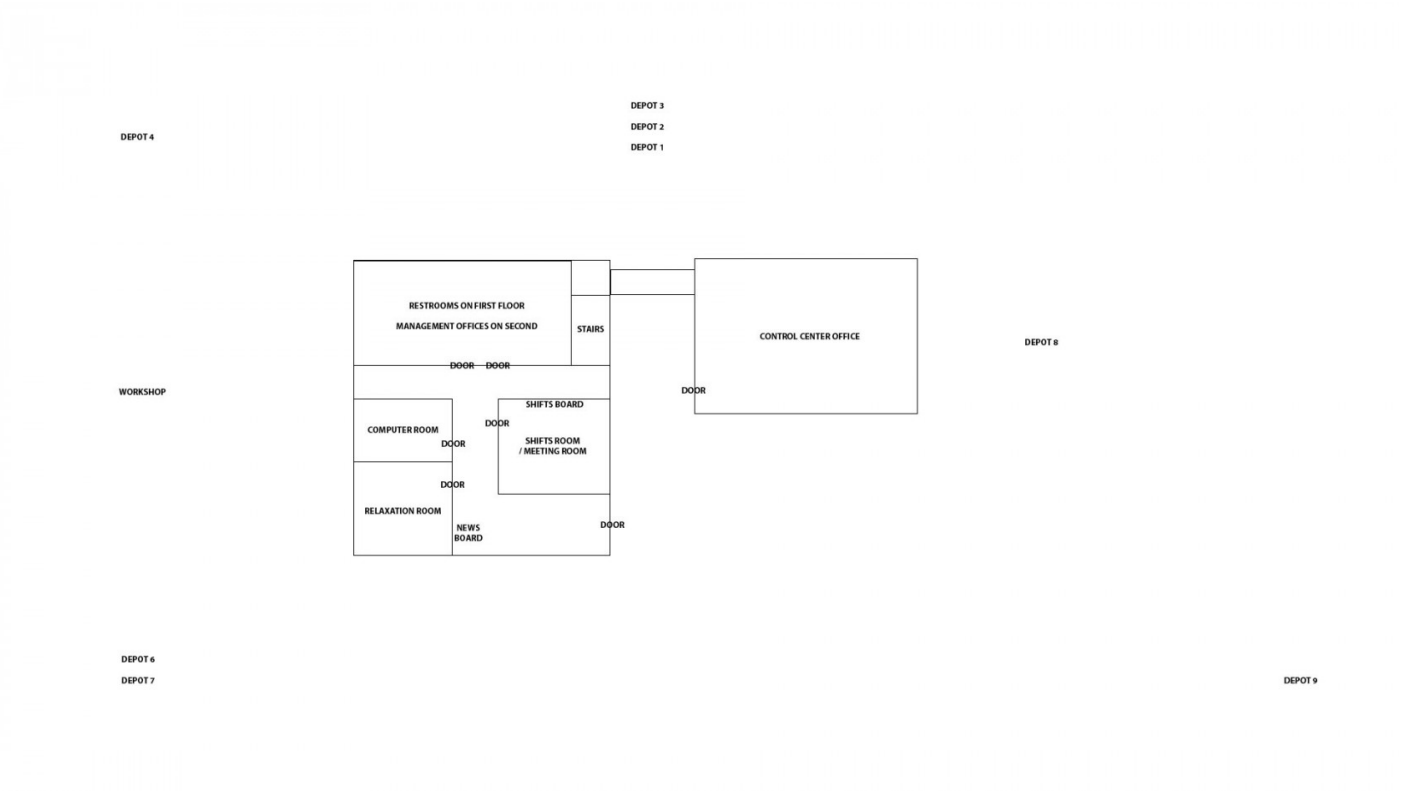

```
[ entry]  
bus_doorfront2  
81  
2
```

```
[ entry]  
bus_doorfront3  
75  
2
```

```
[ entry]  
bus_doorfront4  
76  
2
```

```
[ entry]  
bus_doorfront5  
77  
2
```

Gameburrow's OMSI 2 settings

Here are my settings. I'd say these are the maximum you can have in OMSI engine, no matter how high end your computer is.

If it's still lagging, you need to reduce:

- scheduled AI count (this hits performance the most)
- unscheduled AI count even more
- Max sound count is also interestingly something that hits performance quite a lot.

OMSI depends mostly on CPU, RAM and Disk speeds. CPU and RAM are running on 32bit limits thus it can't use more than 4GB of memory.

Installing DXVK from the source

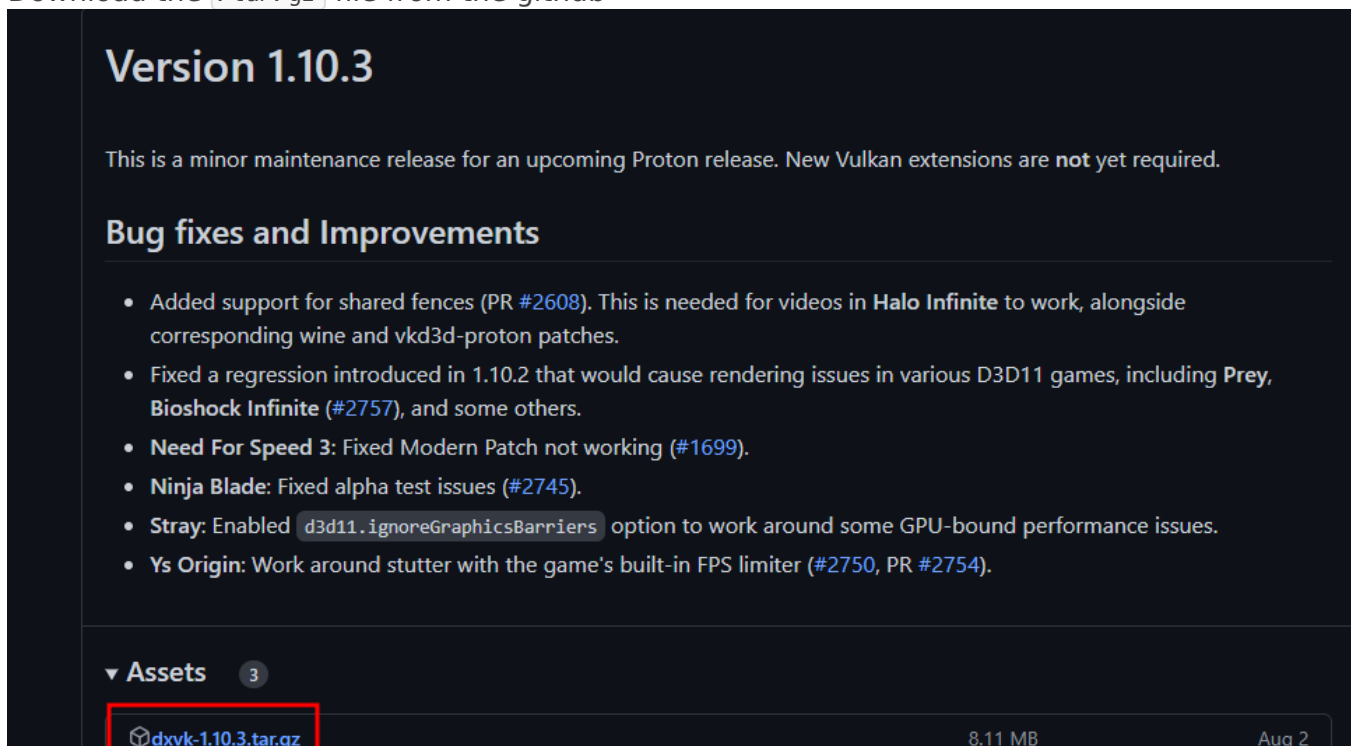

*Many of you probably have heard or even tried the OMSI DXVK (or Performance Fix) on S and found it to improve your OMSI performance but most have abandoned it because it caused issues (like world stops loading, especially at night). However what many don't know is that the versions listed in [Steam Community](#) or [OMSI Webdisk](#) are out of date. **It is actually being updated regularly by the linux community as it's the foundation of what allows to run Windows games on Linux.***

I've found that using the later versions seems fine ish. **It has issues sometimes with night where the map stops loading, if that happens you have to remove it, sometimes restart of the game doesn't help.**

- **Last version tested** by GameBurrow: [2.3](#)
- **All releases:** <https://github.com/doitsujin/dxvk/releases/>

Install instructions

1. Download the `.tar.gz` file from the github

The screenshot shows the GitHub release page for dxvk-1.10.3. The page has a dark theme. At the top, it says "Version 1.10.3". Below that, a description states: "This is a minor maintenance release for an upcoming Proton release. New Vulkan extensions are **not** yet required." The "Bug fixes and Improvements" section lists several updates: added support for shared fences (PR #2608), fixed a regression in 1.10.2, fixed Modern Patch in Need For Speed 3, fixed alpha test issues in Ninja Blade, enabled d3d11.ignoreGraphicsBarriers option in Stray, and worked around stutter in Ys Origin. At the bottom, the "Assets" section shows three files, with the first one, "dxvk-1.10.3.tar.gz", highlighted by a red box. The file size is 8.11 MB and the date is Aug 2.

Version 1.10.3

This is a minor maintenance release for an upcoming Proton release. New Vulkan extensions are **not** yet required.

Bug fixes and Improvements

- Added support for shared fences (PR #2608). This is needed for videos in **Halo Infinite** to work, alongside corresponding wine and vkd3d-proton patches.
- Fixed a regression introduced in 1.10.2 that would cause rendering issues in various D3D11 games, including **Prey**, **Bioshock Infinite** (#2757), and some others.
- **Need For Speed 3**: Fixed Modern Patch not working (#1699).
- **Ninja Blade**: Fixed alpha test issues (#2745).
- **Stray**: Enabled `d3d11.ignoreGraphicsBarriers` option to work around some GPU-bound performance issues.
- **Ys Origin**: Work around stutter with the game's built-in FPS limiter (#2750, PR #2754).

▼ Assets 3

dxvk-1.10.3.tar.gz 8.11 MB Aug 2

2. Open it (I recommend using 7-zip)

3. In it you'll find .tar file, open that one also by double-clicking

4. Now navigate to folder dxvk-version\x32
